# Summary

An important objective of WUDAPT, the World Urban Database and Acces Portals Tools community project, is to 1) to acquire and make accessible coherent and consistent information on form and function of urban morphology relevant to climate weather, and environment studies, and 2) to provide tools that extract relevant urban parameters and properties for models and model applications at appropriate scales for various climate, weather, environment, and urban planning purposes (Ching et al., 2018).

The Python-based WUDAPT-to-WRF (W2W) package is developed in this context, and translates Local Climate Zone (LCZ) maps into urban canopy parameters readable by WRF, the community "Weather Research and Forecasting" model. It is the successor of the Fortranbased W2W package developed by Brousse et al. (2016) and Martilli et al. (2016), and provides a more simple, efficient and improved procedure to use LCZ information in WRF.

# Statement of need

- Since the pioneering work of Brousse et al. (2016) and Martilli et al. (2016), the level-0 WUDAPT information, the Local Climate Zone maps, have been used increasingly in WRF.
- We expect this trend to continue, because of two recent developments: 1) the creation of
- 24 city-wide LCZ maps is now easier than ever with the launch of the online LCZ Generator
- $_{25}$  (Demuzere et al., 2021), and 2) WRF versions > 4.x (Skamarock et al., 2021) are able to
- ingest 10 or 11 built classses (corresponding to WUDAPT's LCZs) by default, whereas previous
- vr WRF versions required manual code changes (see Martilli et al. (2016), Zonato et al. (Under
- <sup>28</sup> Review) and Zonato & Chen (2021) for more information).
- Because of these developments, an improved, Python-based, WUDAPT-to-WRF (W2W) routine
- $_{
  m 30}$  is presented here, so as to make the translation of LCZ-based parameters better and more
- 31 simple.

# 2 Initial data requirements

In order to use the tool, two input files are required:

<sup>\*</sup>corresponding author

- 1. A geo\_em.d0X (.nc) file for the inner WRF model domain in which one would like to use the LCZ-based information. This file can be produced by WRF's geogrid.exe tool as part of the WRF Preprocessing System (WPS). @ ANDREA: does a user needs to use specific settings here to create this file?? Please extend this section if needed.
- 2. A **Local Climate Zone map** (.tif) file that is slightly bigger than the domain extent of the geo\_em.d0X.nc file. There are a number of ways to obtain an LCZ map for your region of interest (ROI):
- Extract your ROI from the continental-scale LCZ maps for Europe (Demuzere et al., 2019) or the United States (Demuzere et al., 2020) (see here for more info).
  - Check if your ROI is already covered by the many LCZ maps available in the submission table of the LCZ Generator.
  - Use the LCZ Generator to make an LCZ map for your ROI. See also here for more information.

### Workflow

45

46

47

- The goal of the Python-based W2W tool is to obtain a WRF domain file (geo\_em.d0X.nc)
- $_{50}$  that contains the built LCZ classes and their corresponding urban canopy parameters rele-
- vant for all urban parameterizations embedded in WRF: the single layer urban canopy model
- Noah/SLUCM (Kusaka et al. (2001)), the Building Environment Parameterization (BEP,
- Martilli et al. (2002)), and BEP+BEM (Building Energy Model, Salamanca et al. (2010)).
- To get to that point, a number of sequential steps are followed:
- Step 1: Remove the default urban land cover
- 56 The default urban land cover from MODIS is replaced with the dominant surrounding veg-
- etation category, as is done in Li et al. (2020). This procedure affects WRF's parameters
- 58 LU\_INDEX, LANDUSEF and GREENFRAC. LU\_INDEX is selected as the dominant category
- from the nlus (default = 45) nearest grid points (excluding ocean, urban and lakes). LAN-
- DUSEF and GREENFRAC are calculated as the mean over all grid points with that category
- among the nlus nearest points. **@ DANIEL: CORRECT??**
- Resulting output: **geo\_em.d0X\_NoUrban.nc**
- Step 2: Define the LCZ-based urban extent
- LCZ-based impervious fraction values (FRC\_URB2D, available from LCZ\_UCP\_default.
- 65 csv) are assigned to the original 100 m resolution LCZ map, and are aggregated to the
- $_{ ext{ iny 66}}$  WRF resolution. Areas with FRC\_URB2D < 0.2 (frc) are currently considered non-urban  $oldsymbol{ ext{ iny 66}}$
- 67 ANDREA ADD SMALL SENTENCE TO STATE WHY THAT IS. The FRC\_URB2D
- 68 field is also used to mask all other urban parameter fields, so that their extent is consistent.
- 69 Resulting output: **geo\_em.d0X\_LCZ\_extent.nc** 
  - Step 3: Introduce modal built LCZ classes
- 71 For each WRF grid cell, the mode of the underlying built LCZ classes is added to LU\_INDEX
- (numbered from 31-41). See here for more info. Note that the W2W routine by default considers
- LCZ classes 1-10 as built classes (bc). Sometimes, also LCZ E (or 15 Bare rock or paved)
- can be considered as a built LCZ classes, as it might reflect large asphalt surfaces such as big
- $_{75}$  parking lots or airstrips. In that case, make sure to set the bc argument appropriately.

Step 4: Assign urban canopy parameters

Two pathways are followed when assigning the various urban canopy parameters to the LCZ map, and translating this information onto WRF's grid:

Pathway 1: Morphological parameters are assigned directly to the high-resolution LCZ map, and are afterwards aggregated to the lower-resolution WRF grid. In this way, the method produces a unique urban morphology parameter value for each WRF grid cell. This was found to be more efficient in reproducing urban boundary layer features, especially in the outskirts of the city (Zonato et al., 2020), and is in line with the WUDAPT-to-COSMO routine (Varentsov et al., 2020).

Morphological urban canopy parameter values are provided in LCZ\_UCP\_default.csv, and are generally based on values provided in Stewart & Oke (2012) and Stewart et al. (2014). In addition:

- Building width (BW), available in LCZ\_UCP\_default.csv, is taken from URBPARM\_LC Z.TBL (stored in WRF's run/ folder).
  - While URBPARM\_LCZ.TBL also has values on street width, W2W derives street width from the mean building height (MH\_URB2D) and the Height-to-Width ratio (H2W), to have these fields consistent.
  - Plan (LP\_URB2D), frontal (LF\_URB2D) and total (LB\_URB2D) area indices are based on formulas in Zonato et al. (2020).
- HI\_URB2D is obtained by fitting a bounded normal distribution to the minimum (MH\_URB2D\_MIN), mean (MH\_URB2D), and maximum (MH\_URB2D\_MAX) building height, as provided in LCZ\_UCP\_default.csv. The building height standard deviation is also required, and is approximated as (MH\_URB2D\_MAX MH\_URB2D\_MIN) / 4.
- For computational efficiency, HI\_URB2D values lower than 5% were set to 0 after resampling, the remaining HI\_URB2D percentages are re-scaled to 100%.

Pathway 2: In line with the former Fortran-based W2W procedure, radiative and thermal parameters are assigned to the modal LCZ class that is assigned to each WRF grid cell (see Step 3). These parameter values are not stored in the netcdf output, but are read from URBPARM\_LCZ.TBL and assigned automatically to the modal LCZ class when running the model.

• Step 5: Adjust global attributes

In a final step, some global attributes are adjusted in the resulting netcdf files:

- NBUI\_MAX is added as a global attribute, reflecting the maximum amount of HI\_URB2D classes that are not 0 across the model domain. This paramater can be used when compiling WRF, to optimize memory storage.
- NUM\_LAND\_CAT is set to 41, to reflect the addition of 10 (or 11) built LCZ classes. This is not only done for the highest resolution domain file (e.g. d04), but also for all of its parent domain files (e.g. d01, d02, d03). As such, make sure these files are also available in the input data directory.

Resulting output: geo\_em.d0X\_LCZ\_params.nc

# Integration in WRF's preprocessing

**Q ANDREA**: Can you write a small text to describe 1) where this tool sits within WRF's typical workflow and 2) what needs to be done afterwards? E.g.:

- what a user needs to do after running the tool (eg. renaming netcdf outputs, what WRF tools to launch etc ...)
  - indicate what namelist settings are required?

Perhaps it would make sense to have a schematic, similar to the first half of this Figure Figure 1, available from MeyerandRiechert(2019)?

Figure 1: WRF workflow example.

### Potential use cases

The files provided as output by W2W allow a wide range of applications, including - but not limited to - addressing the impact of:

- urbanization, by running WRF with the default geo\_em.d0X.nc and the geo\_em.d0X.nc files (see for example Li et al. (2020) and Hirsch et al. (2021)).
- an improved urban land cover description, by running WRF with the default geo\_em.d0X.nc and the geo\_em.d0X\_LCZ\_extent.nc files (similar to for example Bhati & Mohan (2018) and Mallard et al. (2018)).
- a more detailed (LCZ-based) urban description, by running WRF with the default geo\_em.d0X.nc and the geo\_em.d0X\_LCZ\_params.nc files (see for example Brousse et al. (2016), Hammerberg et al. (2018), Molnár et al. (2019), Wong et al. (2019), Patel et al. (2020), Zonato et al. (2020), Ribeiro et al. (2021), Hirsch et al. (2021) and Patel et al. (2021)).

## Important notes

- The LCZ-based urban canopy parameter values provided in LCZ\_UCP\_default.csv and URBPARM\_LCZ.TBL are universal and generic, and might not be appropriate for your ROI. If available, please adjust the values according to the characteristics of your ROI.
- It is advised to use this tool with urban parameterization options BEP or BEP+BEM (sf\_urban\_physics = 2 or 3). In case you use this tool with the SLUCM model (sf\_urban\_physics = 1), make sure your lowest model level is above the highest building height. If not, real.exe will provide the following error message: ZDC + ZOC + 2m is larger than the 1st WRF level Stop in subroutine urban chan ge ZDC and ZOC @ ANDREA: Correct??
